Stress free caring ...

INFRA RED MOTION DETECTOR

Sense-it monitoring systems are available in two packages depending on individual need. All are easy to install and simple and secure to operate. Alarms can be transmitted through a failsafe radio link to an advanced pager with 450m range or wired directly to a Nurse Call system

A A discreet detection unit with a infra red motion detector remote from the bed. The alarm is raised as soon as the users foot descends to the floor. The same sensor can be positioned to detect them sitting up, leaving a room, or entering a dangerous area. It can also detect door usage, where a door may be left open and replacing door mats which can be a trip hazard.

CHAIR OCCUPANCY MONITOR

B A bed/chair occupancy mat that detects the weight of the person lying in bed or sitting in a chair and raises an alarm to the pager through a failsafe radio link, either immediately on vacation, or after a prolonged period. A unique feature is that if reset whilst the user is out of bed or a chair it will stop detecting alarms until the user returns later.

The occupancy mat can be changed for various other styles of sensor to suit the user need, please ask for details.

BED OCCUPANCY MONITOR

Radio systems come with an advanced radio pager. The pager distinguishes between the different severities of each alarm and is powered by rechargeable batteries. For professional use a 32 channel revision is available.
